

Star Wars Identities:  
Luke ROTJ Hero Note

# Emitter Nipple

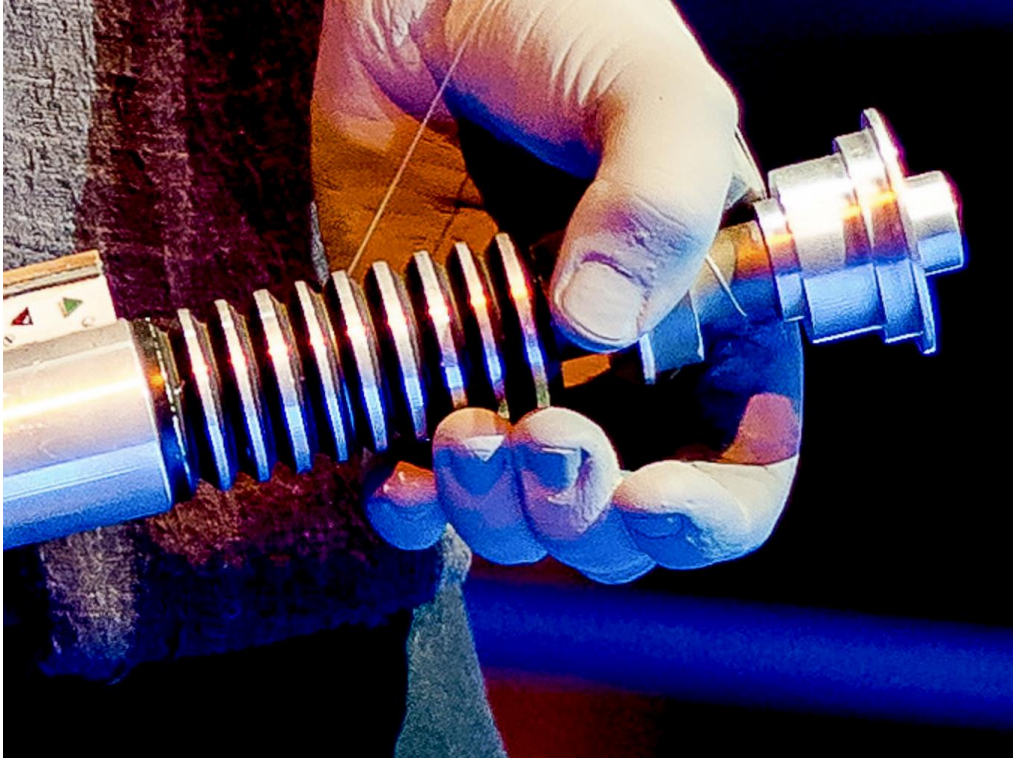

Inside the emitter nipple, there seems to be a dark painted small circle or a drilled hole. Surrounding this dark circle is a plain, wider circumference aluminum area. The depth seems to be about as deep as the emitter flange.

# Emitter & Neck

The inside corner cuts in the emitter and the neck seemed ever-so-slightly rounded off. This *could* be because of the paint and dirt build up and not because the metal itself is rounded off. Especially down in the neck section, the corner cuts appear rounded off.

# Grenade Section

From my observation, the V-cuts in the grenade appeared to have been cut to the point. That said, I did notice some dirt / paint build up, so it's likely the V-cuts are slightly rounded off because of paint.

# Control Box

Due to the lighting and the mannequin position, it was difficult to see the control box. I was able to observe the L-shaped brass rail and the grey rail part assembly, which are already well documented at this point.

However, between the rails and the grenade, the metal plate seemed to have a hairline scratch, machine mark, or metal tape. I did not see any metal tape or filled holes on the other side of the box.

# Booster

In the recessed booster area, the line closest to the clamp box appears to be a 90 degree cut. Meanwhile, the line further away seems to be very slightly beveled.

# Pommel

The pommel end cap section is completely flat. No raised section around the center hole. However, there is a light scratch circle around the hole. This part is not raised; I can 100% confirm this.
